

If value double-clicked and manually backspaced, make it be removed versus displaying a zero

I pasted these reference values into the chart, but there’s currently no way to save this column.

Maybe this would be an ideal situation for a “save data” button in the left margin.

Lot number (Appears on chart)	Date entered	Value
lot1		
lot2		
lot3		
lot4		
lot5		

Also, even if I enter a single value and hit Enter, the script ends up cutting off all reference values below that entered values row.

2 more columns of calculations: (Simple compared to Cpk & Ppk)

Cp: (USL - LSL) / (6*cumulative estimated standard deviation) ← Only displays if both Spec Limits are entered.

Pp: (USL - LSL) / (6*cumulative sample standard deviation) ← Only displays if both Spec Limits are entered.

Checkboxes for the ratios line plot:

- ☐ Display Cpk
- ☐ Display Cp
- ☐ Display Ppk
- ☐ Display Pp

Ideally, would like ability to “rapid enter” values down a column, versus having to move the mouse over to the next cell after each value entry. For a simulation; Open an Excel sheet and start adding values down a single column with just your keyboard arrows. Also you’ll notice that in Excel, if you hit Enter, the next cell is hovered versus making you place your mouse back onto the next cell.

Need to discuss the “undo” button feature, and how it might be accomplished. (In the least,ability to undo the 1 previous change?)

Does every page load have to automatically re-position?

For example, after entering a new value and hitting Enter, the page is automatically shifting back to the top-left:

	Lock Limits	Ref 1 (Appears on chart)	Reference 2	Value
1	<input type="radio"/>			35
2	<input type="radio"/>			37
3	<input type="radio"/>			34
4	<input type="radio"/>			1
5	<input type="radio"/>			1
6	<input type="radio"/>			3
7	<input type="radio"/>			
8	<input type="radio"/>			
9	<input type="radio"/>			

LOWER PRIORITY:

When pasting in data, the chosen Lock Limits location isn't being reflected on the charts right away:
For example, create a subgroup 1 chart and paste in about 30 values. Without doing any other edits, you'll see that the Control Limits displayed on the charts are incorrectly based on the overall dataset (the bottom cumulative values).
The page is requiring you to make a manual change to the data for the correct Control Limits to be displayed (such as adding a new value or moving the Lock Limits position).
Can you make sure that it immediately displays the correct Control Limits?

When a logged-out user opens a chart link, would be nice to see something like, "Create account or log in to view this chart". And then be taken to the chart once logged in.

TASKS BEFORE PUBLIC LAUNCH:

- Email verification link at signup and message that account was registered.
- Hide the cumulative values columns from the chart space (after we confirm all calculations are correct).

- Integrate in menu with logo, and homepage
- Deploy to spccharts domain
